

COMPACT ON-CAR ENGINE HEATER

Maxwell Industries teamed up with P1 Australia to offer this entirely new design of engine heater that provides a simple, fast and easy way to heat your engine. This new compact engine heater weighs a little over 2 lbs. and can be mounted anywhere in the engine compartment. Just run one hose from the head or block on each side of engine to heater. Two hoses total! No other connection is needed - just plug in and go. No inline radiator hose valve, no quick releases to plug in. It is a totally self-contained heating unit.

It mounts with 4 dzus buttons on one of your engine side panels. The heater only requires 13 amps or about a 1600 watt generator to make it work. It will heat the engine up to 180 degrees and keep it there. There are no buttons to push and no switches to turn on; just plug it in.

It's nice not having a heater to load/unload every night and having the extra space in the trailer.
